June 15, 2020

Planning Commission
County of Santa Cruz
701 Ocean Street
Santa Cruz, CA 95060

AGENDA: June 24, 2020
ITEM: #9

SUBJECT: Planning Commission Use Determination for 500,000 gallon ethanol distillation facility at 371 Calabasas Road, Watsonville (Whiskey Hill Farm, Blume), located in the Commercial Agricultural (CA) zoning district.

Members of the Planning Commission:

On May 8, 2020, a Pre-application/Consultation was submitted to the Planning Department by Ken Hart, Swift Consulting Services on behalf of the owner Mr. Blume. The primary objective of the Pre-application was to obtain a Use Determination and permitting information for a new ethanol distillery on a parcel located in the CA zone district. Upon evaluation, staff was unable to clearly identify a land use category under which a large-scale ethanol distillery would be classified, as this is a unique land use that is not clearly addressed in the County's Land Use Charts. In accordance with County Code Section 13.01.050, it was determined that the prudent next step would be to confer with the Planning Commission, with the goal of obtaining direction regarding the appropriate land use category for an ethanol distillery. The County Code provides for such Use Determinations to be made by the Commission upon referral by the Planning Director.

On June 15, 2020, the applicant submitted additional materials for the Planning Commission's consideration. The new materials include a scaled down proposal, from a 500,000 gallon ethanol distillery to a 150,000 gallon distillery and 150,000 gallon fertilizer manufacturing operation. Guidance from the Planning Commission on the scaled back proposal would be helpful to staff.

Project Description

The proposed project includes construction of a new ethanol alcohol distillery and processing facility, approximately 7,700 square feet in size, on a 14.5 acre parcel located in the CA zone district. The property is presently developed with approximately 215,000 square feet of greenhouses, a packing/cold storage facility, a single-family residence, barn, office building and several ancillary buildings. The proposed processing facility improvements would consist of a newly constructed 7,700 square foot canopy, several prefabricated shipping containers, processing equipment, and a series of tanks (max size 5,000 gallons).

The proposed distillery would facilitate production of both ethanol alcohol and fertilizer. Ethanol alcohol is a key ingredient in a variety of products, including alternative fuels and sanitizing products. Fertilizer would be a naturally occurring by-product of the distillation process. The distillery would be fueled by agricultural waste, both generated on the existing farm, and via delivery from farms located throughout the County. The waste would be fermented and distilled on site, with the alcohol and raw fertilizer that

is the by-product of the fermentation and distillation process. A portion of the alcohol and fertilizer produced would be utilized on-site, to support operation of the existing farm. A secondary by-product of the distillation process, methane, would also be utilized on-site (to fuel the existing boilers).

The bulk of the primary product, ethanol alcohol, would be sold and shipped off site to second party companies, to be utilized in the manufacturing of their products. Two such examples were provided in the materials provided by Blume; a hand sanitizer manufacturing company and the City of Watsonville, to power their fleet of city vehicles. The secondary product, fertilizer, would be utilized on site and shipped off-site for future sale to local agricultural operations.

Zoning & General Plan Analysis

Whiskey Hill Farm is located within the CA (Commercial Agriculture) zone district. The General Plan designation is AG (Agriculture). The subject parcel is classified as Type 3, "unique" farmland. The purpose of the CA district is "to preserve the commercial agricultural lands within Santa Cruz County which are a limited and irreplaceable natural resource, and enhance the general welfare of the County as a whole by preserving and protecting agriculture, one of the County's major industries. Within the CA Commercial Agriculture Zone, commercial agriculture shall be encouraged to the exclusion of other land uses which may conflict with it." The added designation as Type 1A farmland classifies the parcel as being "prime" or "unique" farmland or rangeland in accordance with the U.S. Department of Agriculture Soil Conservation Service and the California Department of Food and Agriculture criteria.

Principally permitted uses in the CA zone district include agricultural activities, such as farming, and agricultural support facilities, including single family residences, caretakers units, barns, greenhouses, and community energy systems.

Land Use Types to Consider

Agricultural Support Facility

In the proposal, Blume explored multiple potential permitting paths. One path would be to classify the proposed alcohol production facility as an accessory (to the primary agricultural) use under the use category of "agricultural support facility", which in accordance with SCCC 13.10.312 is defined as "a support facility for processing, packaging, drying, storage, and refrigeration of produce..." The production of 500,000 gallons of alcohol for the purpose of off-site sale to a hand sanitizer company and a government agency for fuel, and production of fertilizer for sale, does not appear to comport with the intent of this land use type. While the methane, fertilizer, and limited amounts of the alcohol proposed to be produced will be utilized on-site in support of the existing agriculture operation, the remaining 500,000 gallons of alcohol is proposed to be shipped off-site to for other purposes. Further, large quantities of raw off-site material would need to be brought onto the site to fuel the production facility. The volume, frequency or nature of the transport and storage of the agricultural waste that would be brought to the site, and the process of converting it into fertilizer, has not yet been made clear. It is uncertain whether an operation of this scale would be considered ancillary or accessory to the existing operation. Agricultural Support Facilities are permitted in the CA zone district with Level IV permit approval.

Winery

Another permitting path explored by Blume was to classify the proposed ethanol facility as a "winery". As defined in the Code, a winery is described as follows "winery means structures, facilities, and equipment used for the production of more than 200 gallons of wine per year. The production of wine means the conversion of grapes, berries, and other fruit into wines, including fermentation and bottling." While an ethanol alcohol production facility does entail the import of off-site agricultural product and fermentation of that product, it does not entail "the conversions of grapes, berries and other fruits into wine". Wineries with over 100,000 gallons of annual production are permitted in the CA zone district

with Level VI permit approval. One potential path would be to equate a “distillery” to a winery, however when discussed in the past as related to the draft Code Modernization, a distillery was considered to be for consumable alcohol such as scotch, gin or other alcohol and envisioned as smaller in scale than a 500,000 gallon operation. Nonetheless, if the Planning Commission were to determine that the proposed distillery was sufficiently similar to a large winery, then it could be considered through the Level VI permit process.

Energy Facility and Energy Facility – Community

Pursuant to the Code, an Energy Facility is defined as follows: “energy facility means any public or private processing, producing, generating, storing, transmitting, or recovering facility for electricity, natural gas, petroleum, coal, or other energy resource; *excluding* solar systems, wind energy conversion systems, and community energy systems. In reading the Blume project proposal, the applicant indicates that in the long-term, once the COVID 19 crisis is behind us and the need for increased hand sanitizer production has decreased, the ethanol alcohol produced by the facility would be used as a fuel source. The applicant provided Letters of Interest from two parties expressing interest in purchasing the ethanol for use as fuel, both from the Pajaro Valley School District (to fuel their school buses) and the City of Watsonville (to fuel their fleet of city vehicles).

In referencing back to the definition of “energy facility”, a facility that produces ethanol, which is an energy resource, appears compatible with this use type. However, energy facilities are classified as primarily “industrial” uses and are not permitted in the Agricultural zone districts, such as the CA zone district.

Energy Facilities, *community*, are permitted in the CA zone district with Level V permit approval; however community energy facilities are defined in the Code as being “an energy producing facility which simultaneously produces *electricity and useful thermal energy* for use in more than one building; including all storage and transmission facilities associated with the community energy system.” The proposed ethanol alcohol production facility would be producing an energy resource, but that resource is not electricity. Therefore, the proposed use would have to be judged as sufficiently similar to a community energy facility in order to be able to be considered in the CA zoning district through a Level V process (which staff would likely elect to elevate to a Level VI process given the off-site aspects of the use that are needed to support the one-site distillation use).

When full information about the energy production aspect of the project is available, an analysis of whether the project complies with policies in the General Plan and Climate Action Strategy addressing greenhouse gas emissions can be undertaken.

Agricultural Service Establishment

Pursuant to County Code, an Agricultural Service Establishment is defined as follows, “a business engaged in activities designed to support agricultural production and marketing such as application of agricultural chemicals, grading and irrigation contracting, harvesting, hauling of produce or other agricultural products, and large scale off-site cold storage facilities. This service does not include manufacturing or processing.” The proposed facility would entail the production of two products that support agricultural production, ethanol, which can be used to fuel equipment and vehicles, and fertilizer, which can be used for soil enhancement. The proposed use does seem to fit the definition of an Agricultural Service Establishment, however that land use category is not a permitted use type in the CA zone district.

Manufacture of Fertilizer

Production and sale of fertilizer is envisioned as a third activity, along with the activities of distilling and energy production. The applicant has not provided information about the scale of the fertilizer production and the specific activities that would be undertaken on site to convert the agricultural waste

by-product into fertilizer and to prepare it for use on fields. The manufacture of fertilizer is only listed as an allowed use in the industrial uses chart, as appropriate for M-1 and M-2 zoning with discretionary approval and is not permitted in the Agricultural zone districts, such as the CA zone district.

The use chart does not anticipate the manufacture of fertilizer as an activity that would be associated with a different activity, such as the distillery, which would not normally be sited on M-1 or M-2 property. Direction is therefore sought on whether fertilizer production can be considered appropriate for CA in these circumstances, and if so, what would be appropriate limits on the scale and other characteristics of the operation.

Once information more information about the fertilizer aspect of the project is available, an analysis of whether the project complies with policies in the General Plan and Climate Action Strategy addressing greenhouse gas emissions can be undertaken.

Use Determination/Guidance

The County Code includes many land use categories, which cover a wide range of land uses; however, on occasion the Planning Department encounters a unique land use type or a project that involves a combination of land use types, which are not explicitly addressed in the Code. An ethanol alcohol distillery with associated energy and fertilizer production is one such situation. Guidance from the Planning Commission would serve to assist staff and the applicant in categorizing this land use type and inform the permitting path moving forward.

Exhibits:

- A. Whiskey Hill Farms Project Proposal and Attachments

- C. Excerpts from Agricultural Use Charts in Chapter 13.10.312
- D. Excerpts from the Industrial Use Chart in Chapter 13.10.342

Whiskey Hill Farms Project Proposal

Introduction

Whiskey Hill farms applied to the Planning Department for a Project Consultation requesting a determination regarding a proposed use to produce fertilizer and alcohol as a part of its agricultural operation. That project consultation originally proposed the production of 4,500,000 gallons of liquid organic fertilizer and 500,000 gallons of alcohol. Since that time, the owners have scaled back this request and are now proposing a distillation operation capable of producing 150,000 gallons of fertilizer and 150,000 gallons of alcohol per year. The Planning Department has deferred this use determination to the Planning Commission. The purpose of this Study Session, therefore, is to request that the Planning Commission make a determination that a distillery capable of producing 150,000 gallons of liquid organic fertilizer and 150,000 gallons of alcohol from agricultural plant waste material is an allowed use in the Commercial Agriculture zone district.

Whiskey Hill Farms conducts agricultural activities on APN 049-171-21, located at 371 Calabasas Road (see attached parcel map). The parcel is estimated to be 14.542 acres in size and is developed with approximately 215,000 s.f. of green houses, a packing/cold storage facility, a single family residence; barn, older house adjacent to Calabasas Rd., office, storage and other ancillary buildings.

The Whiskey Hill Farms cultivation is the primary use on the property, occupying the existing green houses on the site. This is a commercial agricultural operation specializing in high value organic produce and has become the largest producer of organic turmeric in the continental United States within the past three years. Whiskey Hill Farms uses innovative regenerative and sustainable agricultural practices including organic fertilizer and use of energy created by the distillation of agricultural waste to enhance crop productivity and increase yields.

A distillery exists onsite that produces organic fertilizer and alcohol that is derived from agricultural plant waste. This distillery currently produces approximately 100,000 gallons of organic liquid fertilizer and 100,000 gallons of alcohol per year. The Covid-19 crisis has resulted in an acute shortage of sanitizing products, the active ingredient of which is alcohol. This severe shortage is being felt locally and around the world and the increased need for these products will grow well into the foreseeable future as new and better health and personal hygiene practices are adopted by communities and individuals everywhere. Whiskey Hill Farms has a unique opportunity to help meet the local demand for safe, plant-based and petroleum free organic sanitizer products. By scaling up their pilot plant to a system capable of producing 150,000 gallons for fertilizer and 150,000 gallons of alcohol per year, Whiskey Hill Farms will be able to help protect the tri-county area from pathogens and germ spread diseases.

In addition to the production of alcohol, the process results in creation of fertilizer and soil amendments. As described below, the project will provide benefits to other agricultural operations in the area by using their waste products to produce fertilizer.

Project Description

The physical improvements for the distillery facility will be located between an existing green house, office, and farm building (see site plan). This area is currently covered with a concrete slab. A metal canopy, approximately 1,100 SF in size, would be installed to cover the area for some of the tanks associated with the distillery. The remainder of the distillery would be located inside the adjacent building. The use in this existing building would comprise approximately 1,500 SF of floor space.

The following describes, in general terms, the processing of the agricultural plant waste material and the resulting products:

The feed stock for the distillery operation will be derived from plant biomass produced on-site, as well as importation of apple pulp and damaged apples that cannot be used in the juice making process. A portion of the plant biomass produced on-site will be grown in the existing green houses. The remainder will be derived from approximately seven acres of fallow land on the parcel that will be planted with sweet sorghum, coastal sugar cane, sugar beets, and turmeric. Together, these on-site sources will comprise 45% - 55% of the material needed for the distillation process.

Two fermentation processes are used to produce alcohol and fertilizer.

First fermentation: the plant material is first subjected to yeast fermentation (the same process that is required for production of wine by a winery operation). This initial fermentation produces CO₂ gas which is used in the on-site green houses to spur plant growth and results in a liquid and a solid component. The liquid component is distilled; producing alcohol. The treatment of the solid component used to produce fertilizer is discussed below. As indicated above, Whiskey Hill Farms seeks to produce 150,000 gallons of alcohol per year. The following types of alcohol can be produced simply by employing different types of filtration during the finishing process:

- Fuel grade alcohol
- Beverage grade alcohol
- Medical grade alcohol (i.e. sanitizer)
- Pharmaceutical grade alcohol

Market conditions will dictate the type of alcohol to be produced. Initially, medical grade alcohol will be produced as the base ingredient for sanitizing products needed to combat the Covid-19 pandemic.

Second fermentation: Following this initial alcohol distillation process, the remaining solids are fermented again using bacteria, rather than yeast. This bacterial fermentation produces

methane (Renewable Natural Gas - RNG) and liquid fertilizer. The RNG will be used to fuel the on-site boiler (currently petroleum gas powered) and the fertilizer will be applied to the crops produced by Whiskey Hill Farms and delivered to other agricultural operations in the area. As indicated above, for every one gallon of fertilizer produced, one gallon of alcohol as a by-product is distilled.

At full capacity, approximately five truckloads per month of the agricultural plant waste feedstock would be required for the operation. Approximately six truck trips per month are anticipated for shipping the alcohol and fertilizer. On average, seven trucks per day visit the site of the existing farm operations at Whiskey Hill Farms.

Project Objectives

This project has the following benefits:

Organic Fertilizer Production

The production of plant based, non-petroleum organic fertilizer will supply onsite needs as well as the needs of many other local agricultural operations in the area. In this way, it will support and complement onsite operations and the surrounding agricultural community as a whole.

Medical Grade Alcohol Production

As previously discussed, this project would initially produce medical grade alcohol, the key ingredient for disinfection products. The need for these products and the value of this project to supply that key ingredient cannot be stressed enough.

As an example of this pent up demand for sanitizing products, local news stations KION and KSBW aired pieces about the operation and the opportunity to produce alcohol from agricultural waste on April 10 and 11, respectively. That coverage included a method for the public to contact Whiskey Hill Farms to express interest in obtaining this product when available. The local news coverage was picked up by other news outlets and, within a 3 day period, Whiskey Hill Farms received 1,600 emails requesting this product. Email requests have continued to pour in. In addition to 20 letters of support for the project, primarily from local healthcare providers, we have included these initial 1,600 requests.

Cannabis manufacturers have signed Letters of Intent to purchase the highly purified alcohol product, once production commences, for use in the extraction process. It should be noted that cannabis manufacturing operations use alcohol in the extraction process and that alcohol is likely derived from GMO corn from the mid-west and

shipped across the country for use locally.

It is also important to note that alcohol-based sanitizers are required to be used in many facets of agricultural operations to prevent contamination and to ensure consumer safety. These requirements have been promulgated by the Food Safety Modernization Act (a more detailed description of these requirements is attached). Alcohol, itself, an agricultural product derived from agricultural crop-related biomass, plays an integral role on today's farms.

Fuel Grade Alcohol Production

It is envisioned that, once the Covid-19 crisis passes the operation will shift, in part, to the production of fuel grade alcohol. Prior to the onset of the Covid-19 crisis, Whiskey Hill Farms was in communication with the City of Watsonville regarding the production of alcohol to power their fleet and with the Pajaro Valley Unified School District (PVUSD) to fuel their buses to comply with State mandated phase out of the use of diesel fuel due to its extreme toxicity. These two entities could eventually use all of the 150,000 gallons produced per year by the proposed operation.

Efficient disposal and use of agricultural wastes

Presently, much of the agricultural byproduct from agricultural operations throughout the area is treated as waste. This proposal will turn this "waste" biomass into fertilizer and alcohol and reduce the waste stream going to the County landfill.

The Buena Vista landfill will close before the year 2034. The County's Zero Waste Plan is intended to provide a framework for reducing waste that is disposed of in local landfills. One of the Zero Waste Strategy Components is to encourage all sectors to implement zero waste.

Policy and Regulatory Considerations

Proposal is an Allowed Use as an Agricultural Activity

Staff has raised the question as to whether this use would be ancillary or accessory to the agricultural use of the property.

An ancillary use is one that is subordinate to another use. The green houses on the site are approximately 215,000 SF in size. The proposed distillery footprint, including the addition of a new 1,100 SF metal canopy and the use of 1,500 SF of floor space in an existing building, would comprise 1.2% of the green house cultivation area. The area devoted to the distillery as a percentage of the overall agricultural use of the property becomes much smaller if factoring in the planting of the on-site fallow acreage for production of biomass. This calculation shows that

just 0.5% of the area devoted to cultivation would be used for distillation. The use of this small footprint would clearly be ancillary to the dominant cultivation activity on the parcel.

The definition of “accessory” is as follows: “a thing which can be added to something else in order to make it more useful, versatile, or attractive.” The addition of distillation capabilities that result in the production of fertilizer and alcohol on this parcel would tremendously increase the value, usefulness, and versatility of the feed stock used in these processes – agricultural waste material being generated both on this site and on other, surrounding farms. The production of fertilizer from agricultural waste is clearly an accessory and ancillary use to the primary agricultural use of the property.

A distillery for the production of alcohol such as that being proposed is similar in many ways to a winery which is an allowed use in the CA zone. There is no requirement in the winery regulations that dictates the origin of the grapes to be used in the production of alcohol. Wineries do not rely solely on the grapes produced onsite for the production of wine, but commonly import a majority of the grapes used from vineyards located throughout and outside the county. As indicated previously, approximately 45% to 55% of the plant biomass to be used by Whiskey Hill Farm in the distillation process will be derived on-site.

Similarly, cannabis manufacturing is an allowed use in the CA zone and plant material from other permitted and licensed cultivation operations is used in these operations.

There is no justification to treat the production of alcohol from organic agricultural waste differently than the production of wine, particularly in light of the fact that beverage grade alcohol would be produced. In addition, the versatility of this proposed use (production of fertilizer and alcohol that can be used for a variety of purposes) is similar to the multiple purposes for which cannabis can be used (recreational purposes, medical uses, and fiber in the case of hemp) and should be treated similarly.

A zoning code cannot anticipate and explicitly list each and every use. This is especially true when, over time, new uses and new technologies emerge that are embraced by the agricultural industry. This evolution of industry needs and standards must be taken into account when applying regulatory requirements. Uses that are similar to those that are explicitly listed as an allowed use need to be evaluated and permitted taking this broader view.

As previously mentioned, the production of alcohol would, following an eventual reduction in the need for sanitizing products, be used as a fuel source. A market for this fuel has already been shown to exist for powering the City of Watsonville vehicle fleet and Pajaro Valley Unified School District buses. As such, the production of alcohol on the property meets the definition of an energy facility, which is an allowed use within the CA zone district. While the Agriculture Uses chart lists “Energy facilities, community” as a Conditional Use, there is no definition for “Energy

facility, community” in 13.10.700-E. Definitions include “Energy facility” and “Energy system, community”:

“Energy facility” means any public or private processing, producing, generating, storing, transmitting, or recovering facility for electricity, natural gas, petroleum, coal or other energy resource; excluding solar energy systems (refer to SCCC 13.10.700-S), wind energy conversion systems (refer to SCCC 13.10.700-W), and community energy systems (refer to this section).

“Energy system, community” means an energy producing facility which simultaneously produces electricity and useful thermal energy for use in more than one building; including all storage and transmission facilities associated with the community energy system. [Ord. 5083 § 3, 2010; Ord. 3501 § 17, 1984; Ord. 3432 § 1, 1983].

We believe that the proposed use meets the definition of “energy facility” contained in the definitions section of Chapter 13.10, as it comprises a production facility for fuel grade alcohol and hot water heated by RNG.

In addition, the proposed use should be viewed as compatible with the purposes for which the CA zone district was established, as it would serve to efficiently and effectively use plant material waste generated by agricultural operations in the area – wastes that would otherwise need to be disposed of at the County landfill.

Finally, the proposed use would help preserve agricultural land by providing an economic benefit from the use of material that would otherwise be considered a waste product. The use of emerging technologies and approaches to farming that bring financial benefits to the farming community helps to ensure that farming continues to be economically feasible and, therefore, contributes to the preservation of agricultural land.

The County of Santa Cruz, through the adoption of the General Plan, Climate Action Strategy, and the Strategic Plan 2018-2024 clearly supports local energy production and solid waste reduction. The following are policies and goals intended to support those important objectives. We believe that these policies support the type of use being proposed at the Whiskey Hill Farm/Whiskey Hill Farms property:

General Plan Policies

Policy 5.14.8 – Encourage Biomass Cultivation: Encourage the cultivation of crops for biomass fuels without displacing existing agricultural production, especially when such biomass production makes use of marginal land or of crop residues and when the fuel or energy produced is consumed within Santa Cruz County.

While not being specifically cultivated as biomass for energy production, this agricultural plant waste material will be efficiently and effectively used to create energy in a way that complements an existing agricultural use with no detrimental effects on that use.

Policy 5.17.1 – Promote Alternative Energy Sources: Promote the use of energy sources which are renewable, and less environmentally degrading than non-renewable fossil fuels.

Policy 15.17.4: Encourage and stimulate energy conservation and the use of renewable energy through retrofit programs for residential, agricultural, commercial, public facilities and industrial land uses.

The proposed use is very much in keeping with these policies by producing fuel from material that would otherwise be disposed of – material that would actually create climate change gasses if put in a landfill. The use would actually produce fuel in a manner that is far superior to the production and use of non-renewable fossil fuels.

Policy 7.24.8 – Meeting State and Local Landfill Diversion Goals: Consider mandatory recycling or material-specific landfill disposal prohibitions if state and local landfill diversion goals are not met through the use of voluntary programs.

Policy 7.25.8 – Recyclable Materials in Landfills: Consider adoption of landfill disposal bans for specific recyclable or compostable materials where necessary to achieve County materials recovery and landfill diversion goals.

The benefits of this type of waste diversion to our local landfill cannot be understated, given the limited remaining life span of the Buena Vista landfill and the need to transport waste generated in Santa Cruz County to Marina following its closure.

Policy 7.25.11 – Methane Gas: Develop and implement a program for the recovery of landfill methane gas for conversion to electricity or direct use as a fuel.

The secondary fermentation process to develop fertilizer will generate RNG which would replace the use of petroleum-based “natural” gas to fuel the boiler that heats the onsite green houses. No methane will be released to the atmosphere.

Climate Action Strategy

E-4.1 Seek funding for a study to identify renewable energy resources in the County and advise on how the amount of renewable energy generated within the County may be increased over short-, medium-, and long-term.

This is a desirable objective and the proposed project would demonstrate the viability of this type of renewable energy production within the County. Whiskey Hill Farms has a long history of sharing its techniques and strategies for regenerative agriculture with the public, UC Santa Cruz students, public school classes and other interested groups. It has been a featured site on the Ecological Farming Conference bus tours, foreign trade group tours, and other organized “green” and farm tours.

*Table 3-3: Strategies for the Reduction of Greenhouse Gases from Solid Waste
Priority Strategy:*

W-3 Reduce the amount of solid waste, particularly recyclable and compostable materials, in the commercial and residential waste stream

Again, this proposed project would have a direct effect on reducing the waste stream to the local landfill and would also provide an example about the viability of this approach.

Strategic Plan 2018-2024

The Santa Cruz County Strategic Plan 2018-2024 outlines a number of objectives to be pursued by County government. The Strategic Plan establishes a vision, mission, values, focus areas and goals for the County of Santa Cruz. The Plan establishes goals in a number of focus areas that, if achieved, will enhance the local economy, environment, and quality of life for county residents. Two of these focus areas in particular are germane to the evaluation of the proposed project on the Whiskey Hill Farm property. These relate to achieving a Sustainable Environment and a Dynamic Economy.

The “Sustainable Environment” focus area indicates that the County intends to “support and strengthen efforts for clean air and water, conservation, renewable energy, recycling and reuse.”

This project would directly support these efforts through producing clean renewable energy by using agricultural waste as feed stock.

The “Dynamic Economy” focus area contains an element reflecting the need to “strengthen and retain small businesses and key sectors through innovation, flexibility and technology.”

This project would use an innovative approach using proven technology to turn a waste product into a marketable commodity, thereby producing an additional revenue stream attributable to this agricultural property and augmenting the long term agricultural viability of operations on the parcel.

In summary, the forgoing are all desirable policies and objectives established by the County to further sustainability and environmental protection. The proposed use can clearly implement these policies in a manner that complements the existing use of the property without resulting in any negative effects on the existing agricultural use.

Required Special Findings

The proposed project meets the development standards for the CA zone district contained in County Code Chapter 13.10.313 and the required special findings contained in Chapter 13.10.314 can be made:

- (1) That the establishment or maintenance of this use will enhance or support the continued operation of commercial agriculture on the parcel and will not reduce, restrict or adversely affect agricultural resources, or the economic viability of commercial agricultural operations, of the area.

The agricultural use on the property includes the production of organic herbs and vegetables in existing green houses. The proposed production of fertilizer will support and enhance this use. While the primary and immediate use of the alcohol produced will be as a key ingredient in sanitizer (to be produced off site), it is anticipated that a portion of the alcohol will also be used to power the on-site boiler used to heat the green houses and power farm vehicles, replacing use of gasoline and diesel. In addition, the process for producing alcohol involves fermentation of agricultural plant wastes. This process produces fertilizer and heat that will be used to reduce reliance on the boilers need to heat the green houses. Finally, the use will benefit agricultural resources and the economic viability of agricultural operations in the area by affording an alternative method for disposal of waste plant material to surrounding agricultural operations and by the production of fertilizer for local use.

- (2)(a) That the use or structure is ancillary, incidental or accessory to the principal agricultural use of the parcel.

The proposed use is accessory to and complements the agricultural use of the property; in that cultivation within the 215,000 SF of green houses by Whiskey Hill Farms is the principal use of the parcel. The use would increase the value, usefulness, and versatility of agricultural waste material through its reuse and repurposing.

In addition, a distillery for the production of fertilizer, alcohol, and fuel is similar in many ways to a winery which is an allowed use in the CA zone. Wineries do not rely solely on the grapes produced onsite for the production of wine, but import grapes from numerous vineyards located throughout and outside the county. Similarly, cannabis manufacturing is

also an allowed use in the CA zone and plant material from other permitted and licensed cultivation operations is imported from these other properties. Because this use is similar to these others that are explicitly listed as allowed uses, a similar framework for evaluation and findings of consistency can be applied.

(3) That single-family residential uses will be sited to minimize conflicts, and that all other uses will not conflict with commercial agricultural activities on-site, where applicable, or in the area.

A residential use of the property already exists and this project will not change or affect that use.

(4) That the use will be sited to remove no land from production (or potential production) if any non-farmable potential building site is available, or if this is not possible, to remove as little land as possible from production.

The use will be sited in a 30 foot wide area between two existing structures on the property. This area is not farmable and has absolutely no potential to be farmed.

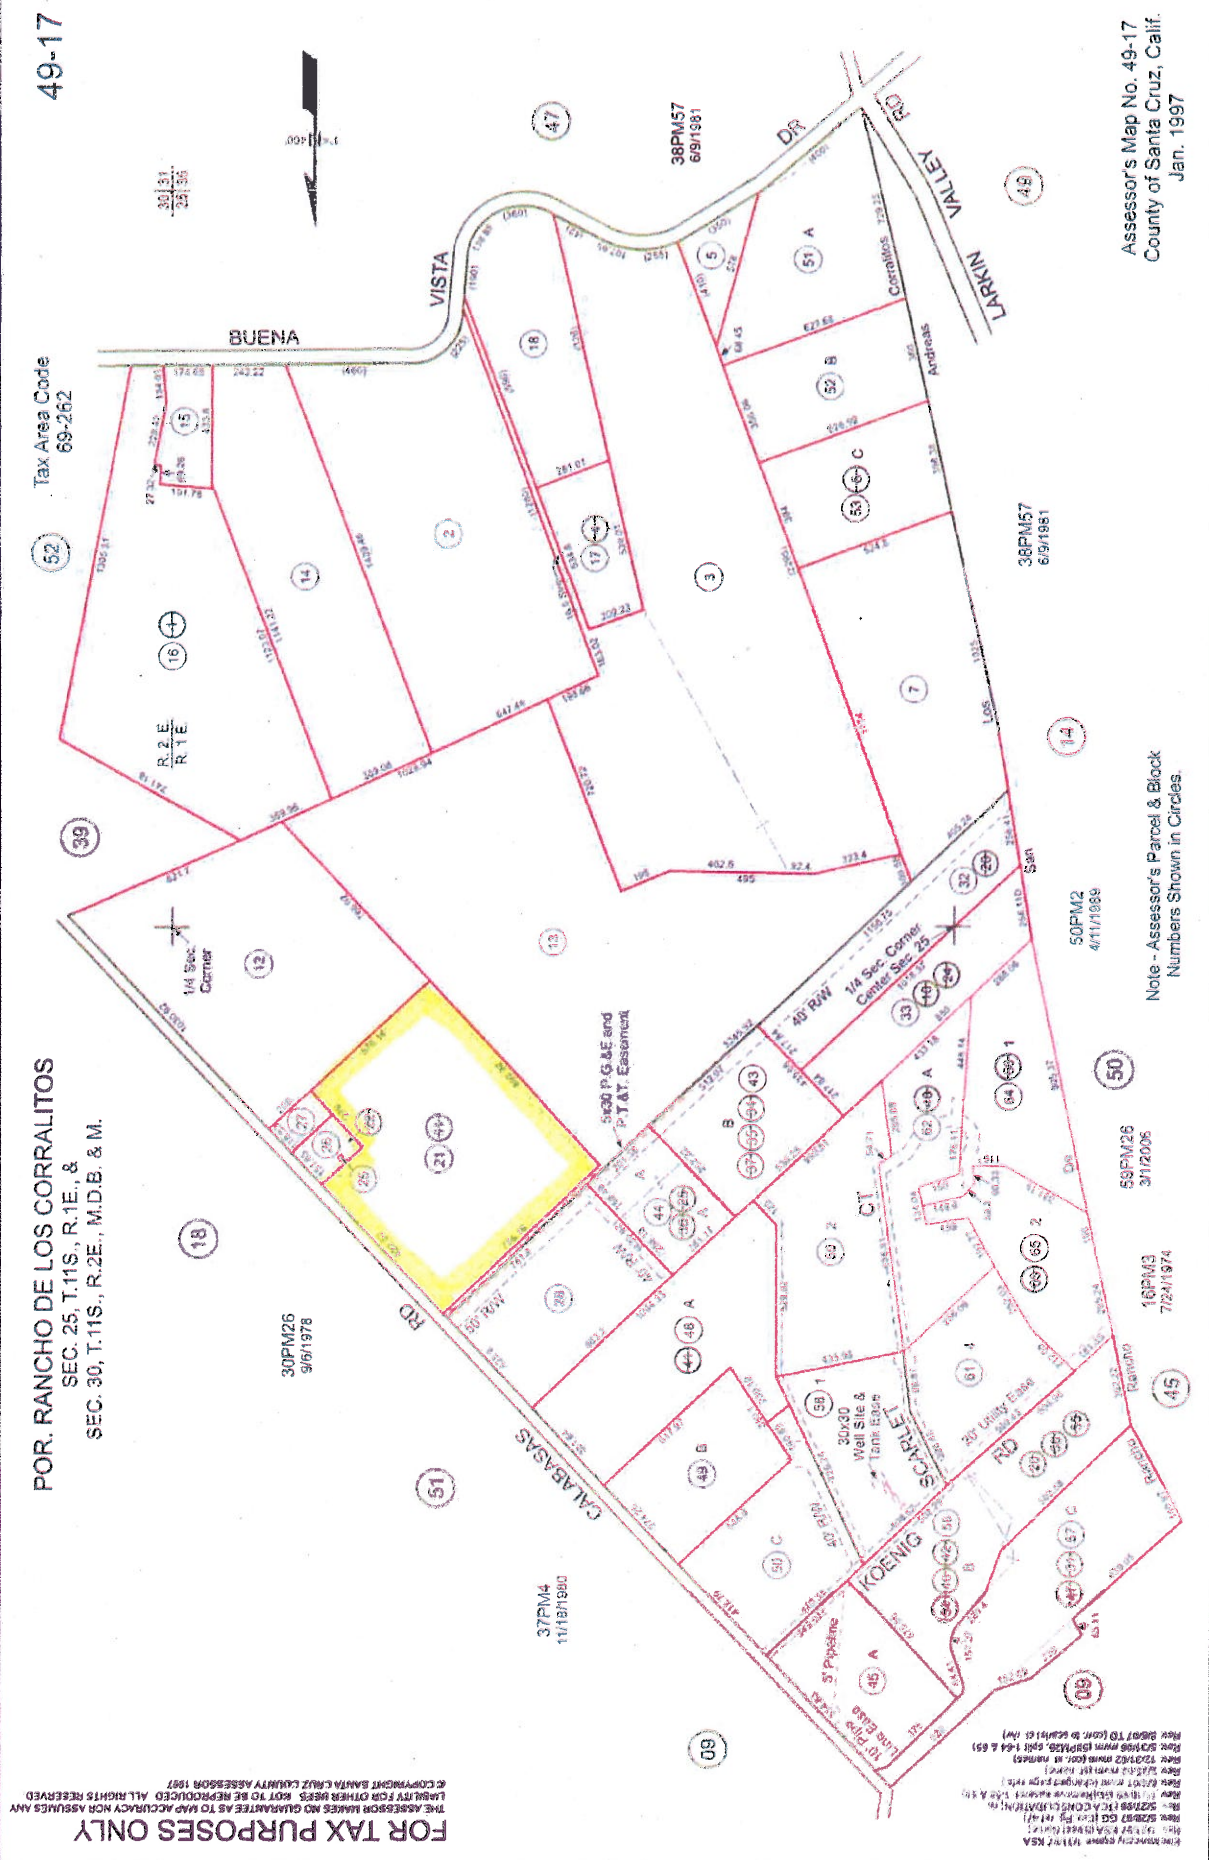

Summary

In summary, we are requesting that the Planning Department find that the proposed use for the production of fertilizer and alcohol (as an ingredient in sanitizer now and as a fuel or other products in the future) is consistent with the intent of the General Plan and Zoning Ordinance.

We understand that a full application for a Minor Variation to the existing Use Permit and a Building Permit will be required. The cost of the applications is significant, so it is imperative that we get confirmation of the consistency of this use with the Zoning Ordinance and General Plan policies and objectives.

Requirement for Alcohol Based Sanitizers in Agricultural Operations

Alcohol-based sanitizers are required to be used in many facets of agricultural operations to prevent contamination and to ensure consumer safety. Alcohol, itself, an agricultural product because it is derived from commercially produced plant material, plays an integral role on today's farms.

The US Food Safety Modernization Act (FSMA) was signed into law on January 4, 2011 and aims to ensure the safe supply of food by preventing contamination rather than responding to it. It is said to be the most significant reform pertaining to food safety in decades. The FDA has adopted various rules to implement the FSMA, including those covering produce safety. These Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption require regular sanitation of a myriad of food processing and other equipment found on most farms. The following is a partial list of the items requiring regular sanitizing:

produce washers	propagation tools
de-mudders	doorknobs
disinfectant sprayer,	tractor steering wheels and gear/transmission levers
harvest crates	pressure washer wands
harvest knives	drainage tables
packing tables	greenhouse sliding doors
floors	irrigation controls and equipment,
scales	walk in cooler walls/floors
harvest tools	fans,
cultivation tools	doors
shoe soles	light switches
forklift wheels	water coolers
plastic pallets,	lunch areas
pallet jack wheels	customer visitation areas
plastic nursery supplies	all office surfaces
computer entry stations	customer product pick-up areas
bulk filling hoses	copiers, fax machines, telephones
pumps	testing equipment
air lines	

As can be seen, the use of alcohol for compliant agricultural operations is required and is widespread. Production of that alcohol should also be seen as an agricultural operation.

RE: Whiskey Hill Farms Application

Dear Kathy and Jocelyn;

Whiskey Hill Farms is proposing to install equipment necessary to produce organic fertilizer and alcohol on their property located at 371 Calabasas Road in Watsonville. The Executive Committee has reviewed information provided to us which describes the proposal in some detail and we want to communicate the Farm Bureau's support for this project. Further, the Farm Bureau urges the Planning Department to find that this use is consistent with the applicable policies and regulations for properties in the Commercial Agriculture Zone District.

The greenhouses on the property are currently used to produce organic herbs and vegetables. Clearly, the crops require fertilizer and, for the type of crops being produced, the greenhouses themselves require the input of energy to function to their maximum efficiency. The production of fertilizer and alcohol on site should be seen as a necessary component of this agricultural operation.

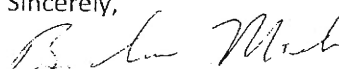

Further, we understand that the alcohol produced will be used, at least initially, as the base ingredient for sanitizing products. Due to the Covid-19 pandemic, these products are in critically short supply and the production of alcohol from agricultural waste by the method being proposed is a truly elegant solution – transformation of what would otherwise be considered a waste product into not one, but two extremely useful products.

The fact that the operation would import feed stock material from off site and result in a net export of the resulting fertilizer and alcohol should, by no means, restrict the ability to carry out this function. The test should be whether the use is ancillary to the agricultural use on the property. The use is ancillary in that, as described above, it would provide necessary support (fertilizer and alcohol fuel) to the primary activity or operation. The project would supply all of the fertilizer needs for the property and, through the use of the alcohol to power the boilers used to heat the greenhouses, the need for propane for this purpose would cease.

Farms and farming operations should not be seen as independent of one another, but rather as interconnected and interdependent. Wineries on Commercial Agriculture zoned land, usually with an onsite vineyard, require the input of material from other farms to produce their wine and that activity is seen as an ancillary use. Similarly, composting of agricultural waste for the production of soil amendments is another common activity that is seen on lands zoned Commercial Agriculture.

Finally, the equipment needed for the fermentation and distillation processes would be located on a very small area between existing buildings that is not farmable now or in the future. For the forgoing reasons, the Santa Cruz County Farm Bureau urges the County find that the proposed use is allowed at 371 Calabasas Road.

Sincerely,

Brendan Miele, President

Re: Whiskey Hill Farms Application

Hello,

I am writing in support of the proposal by Whiskey Hill Farms to build an organic alcohol co-product plant at their farm at 371 Calabasas Road in Watsonville.

My wife and I have operated Greensward / New Natives organic farm in Corralitos since 1983. I am also a member of the Santa Cruz County Agricultural Policy Advisory Commission (APAC).

David Blume and Whiskey Hill Farms has been operating at their current location for 10+ years.

In my recent visit to Whiskey Hill Farm I found a self-contained operation utilizing organic waste and processing by products to produce alcohol at scale. There were no objectionable odors or unsightly conditions present. The plant was in operation and was very quiet.

They propose to upgrade their operation to produce a larger volume of alcohol-based co-products derived from organic waste that would otherwise be taken to the County landfill. In addition the plant will produce organic fertilizer which is always in demand. It will be easy for local farms to absorb this volume of organic fertilizer. Thereby reducing the carbon foot print of Pajaro Valley agriculture and reducing the cost of fertilizer transportation from out the area.

On our farm we are currently in short supply of alcohol based hand sanitizers, with no steady supply in sight.

It's pretty great that Whiskey Hill can utilize the local apple and grape pomace from juice/wine production as one of their inputs. A nice return to the Pajaro Valley's roots and a nod to the future.

I find the Whiskey Hill Farm proposal to be ancillary and beneficial to agriculture in Santa Cruz County.

Sincerely

K-K~
Ken Kimes

Re: Whiskey Hill Farms

Dear Kathy and Jocelyn:

Whiskey Hill Farms seeks to expand their agricultural operation, producing fertilizer to be used on site, by installing equipment to convert local agricultural waste to fertilizer and alcohol. Many intense farm operations, like the subject greenhouse, mix fertilizer for onsite application from products purchased from third parties, as a common agricultural practice. Farmers try to reduce their waste stream by composting cuttings, for later application, and tilling in unsold produce instead of hauling it to the dump. To a large extent the proposed use is no different.

Growers on the Central Coast, including Santa Cruz County, have been very innovative in changing farming practices to reduce local environmental impacts. Good examples are irrigation reduction with drip systems and managed fertilizer applications to minimize excess tailwater. Many crops are processed away from the farm. Processing results in Ag waste. Processors have long sold this to dairy and cattle farms. Not all processing byproducts are suitable for cattle and can add to the landfill where they may contribute to methane discharge, which should be minimized or captured.

The Whiskey Hill proposal to use apple juice retentate as a source for the fertilizer and alcohol production is in essence recycling an existing waste stream and reducing discharge. This innovative environmental solution by a grower, which benefits other agricultural producers, should be encouraged.

The proposed activity is entirely consistent with agricultural uses on CA zoned land. It benefits the existing agricultural use on property and has no impact on adjacent parcels. The proposed use should be allowed.

Sincerely

Kirk F. Schmidt

Re: Whiskey Hill Farms Application

Dear Kathy and Jocelyn,

I am writing in support of the proposal from Whiskey Hill Farms to put a commercial organic fertilizer, livestock feed and alcohol co-product plant at their farm at 371 Calabasas Road in Watsonville.

They propose to upgrade their operation to produce organic fertilizer and alcohol-based co-products derived from agricultural waste that would otherwise be taken to the County landfill. The proposed upgrade would enable them to produce 1,200,000 gallons of organic liquid fertilizer (needed by organic farmers throughout the Tri-county area) as well as 500,000 gallons organic, alcohol-based and safe sanitizer products as well as some alcohol-based diesel replacement fuel annually.

I have worked in agriculture since 1980, having farmed for almost 20 years and continuing to work as an agricultural consultant and Technical Service Provider with NRCS up to the present. I am also a member of the Santa Cruz County Agricultural Policy Advisory Commission (APAC).

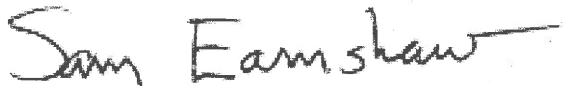

I have known David Blume and the Whiskey Hill Farms for many years, and I led an Ecological Farming Association Bus Tour to the farm several years ago. This is an active certified organic farm that produces a wide variety of standard and unusual fruits and vegetables, in a creative and biodiverse habitat.

The farm produces on-site waste from its production practices, as do all farms, and it plans to bring in and utilize extra agricultural waste to supplement their on-site supply. This is similar to the way wineries bring in product from other vineyards, and is consistent as ancillary to the agricultural use of the property.

Additionally, the location of the proposed plant is for a site between two buildings that is not farmed, and thus, farmland would not be removed for this project.

I believe that this proposed project is a good one for the continuation of agriculture in the Pajaro Valley.

Sincerely,

A handwritten signature in black ink that reads "Sam Earnshaw". The signature is written in a cursive style with a long horizontal stroke at the end.

Letters of Product Demand

EXHIBIT B

City of Watsonville

"A Community of Opportunities"

March 30, 2020

Blume Distillation, LLC
Attn: Tom Harvey, Vice President
P.O. Box 1316
Freedom, CA 95019

Mr. Harvey,

I wish to express interest in Blume's proposal to make and provide locally produced, renewable, plant-based, petroleum-free sanitizer products to help the community combat the COVID-19 pandemic and for future health-related needs through the novel use and repurposing of local plant materials.

The City wishes to explore the following with Blume:

1. Using Blume sanitizer products for the health and safety of City workers.
2. Promulgation or circulation of best practices for local businesses that mitigate exposure to pathogens, viruses, and bacteria through use of products including Blume's locally produced sanitizing products.
3. Aid in addressing questions regarding permitting and regulatory requirements as to the production and transportation of materials to and from the Blume facility as well as the commercial operation of the Blume plant.
4. Encouraging neighboring cities and the County to consider using Blume sanitizer solutions.

The City understands that Blume desires to enter into two contracts with the City. One would be to purchase Blume's Watsonville made skin and surface sanitizer for use in City offices, operations, and with the garbage and recycling services fleet. The second contract would be for consulting services for the development of sanitizing products and better personal sanitation practices for the City's workforce and community.

This Letter of Interest is in no way legally binding, nor does it impose any obligations or confer any rights upon either the City or Blume. This Letter of Interest may, however, be used as the basis for future negotiations and contracts. Blume is also informed that any contract that may result from such negotiations may need to be approved by the Watsonville City Council to be effective.

To Whom It May Concern:

I am a local Santa Cruz health care provider and I would like to be able to purchase and immediately use the alcohol and sanitizer that is being locally and organically produced by Blume Distillation. At this time more than ever it is crucial to our medical practice to find available sources for the sanitizing products that are essential in keeping our practice open, and our patients and practitioners healthy.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting our local business we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

Thank you,

Rachael Henrichsen, L.Ac

March 26, 2020

To Whom It May Concern:

Oh, Oh Organic, Inc. distributes organic and natural ingredients into cosmetic and over-the-counter drug manufacturers throughout the United States and Canada. We have been in this business for twenty years.

It is our observation that there are a very limited number of manufacturers and distributors of USP ethanol for use in cosmetics (denatured). There appear to be 10 to 12 organically certified distillers spread across the country, although it is hard to know their focus, many produce vodkas and other spirits as opposed to Ethanol USP. I have never seen any of them at a cosmetic ingredient trade show and we have not seen them participating in the industry at large. There are two large Ethanol USP manufacturers (Remet and Pharmco) commonly used in the industry. There are the only ones I've seen over the past years participating in the industry. There is a clear need for more competition and supply.

Additionally, the organic and natural cosmetic space is expected to be at around 25% of the total cosmetic industry by 2025. This too will necessitate greater supply. An organic ethanol producer in California will find a rich market here as about 50% of all cosmetics are made in California.

Finally, the increased awareness of the need for sanitization has dried up the current supply of ethanol. It is clear that we need a California based supplier.

The proposed production by Blume Distillation and MBRF1 with their unique process for plant based, petroleum free USP alcohol will meet the need outlined above. Additionally, the project they are working on with our company will provide a line of sanitizers that are critical to healthy communities throughout California.

Best Regards,

A handwritten signature in black ink, appearing to read "Gay Timmons", with a long, sweeping horizontal line extending to the right.

Gay Timmons

Blume Distillation:
Pajaro Valley Unified School District Bioethanol LETTER OF INTENT

This non-binding Letter of Intent ("LOI") is entered into and made effective as of April 18th, 2017 (the "Effective Date") by and between **Blume Distillation LLC**, a Delaware limited liability company, with principal offices located at 371 Calabasas Road Watsonville, California ("Blume") and **Pajaro Valley Unified School District** ("Company"), located at 294 Green Valley Rd, Watsonville, CA 95076.

Blume Distillation designs, markets and implements appropriate-scale commercial biorefinery systems that will produce millions of gallons a year of high-value alcohol-based end and coproducts (including, but not limited to) bioethanol (locally produced and renewable alcohol fuel), antiseptic and pharmaceutical grades of alcohol as well as process coproducts such as commercial grades of Co₂ and organic soil amendments.

Blume Biorefineries convert carbohydrate, starch and sugar-rich waste and cultivated resources to make alcohol fuel, a low-cost, near-zero emission gasoline and diesel replacement fuel, that meet or exceed all the ASTM specifications for producing 99.5% anhydrous industrial grade bioethanol.

Blume produced bioethanol benefits include:

- Eliminating inner-city air pollution from City work vehicles currently running on gasoline and fossil fuels
- Eliminating exposure risks to proven lung-cancer causing diesel fuel emissions from City bus fleets and vehicles
- Significant soil and water pollution reductions
- Resource recovery converting organic materials and food waste resources to low-cost renewable bioethanol fuel, eliminating landfill build-ups and helping attract new food processing business to the City with no waste concern
- Enhancing and expanding energy resilience options through the repurposing of beneficial wastes

BLUME

DISTILLATION

- Optimize liquid-fueled combustion engine performance for transportation providing higher octane, cooler running engines and 99.9% pollution free emissions compared to gasoline
- Creating new local and non-exportable job opportunities

Pajaro Valley Unified School District: The Pajaro Valley Unified School District (PVUSD) is unique in Santa Cruz County. PVUSD is the largest district covering 150 square miles and teaching over 20,500 students. The District's student population has over 68% English learners with 78% of the students living in poverty and 25% of our students classified as migrants. We deliver our educational options at our sixteen elementary schools, six middle schools, three high schools, five charter schools, seventeen children's centers, a continuation high school, an adult education school, and two alternative schools.

In addition to its mission to educate and support learners in reaching their highest potential and pursuant to California Education Code 39831.3, PVUSD is focused on enhancing its plan for school transportation procedures by eliminating the use of costly and toxic diesel powered conveyance fuels for its bus system.

Cited by the World Health Organization and American Lung Association as a top carcinogenic hazard impacting air, water, crops and soil in communities where diesel vehicle use is permitted, diesel fuel has been deemed inappropriate for Watsonville public and private transportation. This is particularly the case for school bus passengers and students who spend long periods of time in diesel emission conveyance and are exposed to idling vehicles assembling for arrival and departure to and from schools.

In support of its Transportation Safety program objectives, PVUSD has identified and determined the benefits of reducing/eliminating its petroleum/fossil fuel dependence and its related toxic emissions impacts on the community and environment. PVUSD is planning to convert its liquid fuel use to locally produced near-zero emission bioethanol as a diesel and gasoline replacement fuel. PVUSD intends to create a pilot to determine if it can run its fleet of School transportation vehicles, including busses, faculty and staff cars and trucks on locally produced bioethanol.

BLUME

DISTILLATION

PVUSD plans to purchase that locally produced clean fuel the Blume Distillation Biorefinery that will be transforming City food waste and appropriate inputs resources into clean alcohol-based biofuel. PVUSD plans to acquire TBD gallons of 99.5% anhydrous bioethanol produced at the Blume Biorefinery upon its biorefinery plant commissioning in Watsonville California, USA. The product will be purchased at \$2.65 a gallon (or at agreed upon current wholesale spot price at time of production) and will be available to the PVUSD fleet as well as Watsonville residents through two Blume owned and operated fuel stations in the community.

This Letter of Intent serves to establish the Company's interest in contracting for the product over a 7 year basis, if the pilot deems to be successful, and confirms the interest of Blume in providing access to said resources on an on-going basis. Blume is committed to helping meet the PVUSD's growing fuel supply market demands and helping enhance its commitment for Health and GHG emission reduction mandate related to school transportation services.

Each of the parties has caused this Letter of Intent to be executed by its duly authorized representatives as of the last date set forth below.

Monterey Bay Renewable Fuels 1, LLC **Pharmaceutical Alcohol: LETTER OF INTENT**

This non-binding LOI is entered into and made effective as of October 2, 2018 by and between Monterey Bay Renewable Fuels 1, LLC, a Delaware limited liability company, with principal offices located at 371 Calabasas Road Watsonville, California ("MBRF1") and Tony Livoti, (President) Monterey Bay International Trade Association (MBITA) ("Company"), located in Santa Cruz, California who is also **representing a sponsor in these regards called IDEA - International Development Exchange Association, which also located in Santa Cruz, California.**

MBRF1 is a supply chain provider of greenhouse amendments and specialty solutions for enhancing and improving operational aspects of greenhouse cultivation, particularly related to the growing herbal tincture and tonic production market.

MBRF1 uses a proprietary Blume Distillation appropriate-scale commercial Biorefinery system to produce 250,000 gallons a year of high-value alcohol-based end and co-products (including, but not limited to) bioethanol, food, antiseptic and pharmaceutical grades of alcohol as well as process co-products such as commercial grades of CO₂ organic soil amendments and fuel supplies for co-gen powered micro-grid electrical systems.

MBRF1 converts carbohydrate, starch and sugar-rich food waste and cultivated resources to make alcohol that meets or exceeds all the US Pharmacopeia specifications for producing 99.5% anhydrous, pharmaceutical grade ethanol.

MBRF1's Watsonville-based plant is capable of providing wholesale commercial supplies of low-cost ultra-clean grades of alcohol, while helping mitigate and repurpose underused and readily available local feedstock (input) resources. Use of the MBRF1 produced alcohols will help improve and reduce landfill waste build-up and eliminate its potential impact on communities and the environment. Local supplies of medical antiseptic, pharmaceutical, and industrial alcohol enhances expands community resilience through the repurposing of beneficial wastes.

Monterey Bay International Trade Association (MBITA) is a non-profit organization dedicated to provide trade promotion services to the California, U.S. and foreign country business communities. MBITA and its global network are also supporting IDEA which is now planning to build 21st-century ecovillages on Native American reservations and in rural Rwanda.

Monterey Bay International Trade Association (MBITA) / TradePort.org

Tel. + 1 - 831-335-4780; Fax +1 - 831-335-4822

P.O. Box 523 – Santa Cruz, CA 95061 – U.S.A. – <http://www.mbita.org> – <http://tradeport.org>

MBITA manages TradePort.org and the [TradePort Collaborator](http://TradePort.org), an online private community of trade promotion service specialists of non-profit organizations and government agencies located throughout California. This intranet is designed to act as a central source of qualified expertise, information, intelligence and contacts that these specialists can utilize to better serve small to mid-sized exporters and importers in California with more effective trade promotion and trade facilitation services.

MBITA currently works with producers of whole food and herbal concentrates for homeopathic and herbal remedy production based on unique, original, local ingredients and formulations providing trade promotion services to support the launch of these innovative products into the global marketplace. MBITA additionally supports IDEA to provide the best solutions that will be utilized in the 'preventive medicine' and 'energy' sector of [IDEA's synergistic ecosystem](http://TradePort.org).

MBITA will connect its current clients and IDEA with MBRF1 to procure pharmaceutical grade ethanol to produce food-based extracts, oils and capsule products for holistic herbal markets, and also for the IDEA 21st-century ecovillage deployment. The production of these products requires the use of the highest purification grades of organic pharmaceutical alcohol, that MBRF1 is uniquely positioned to produce and deliver. MBITA's clients and IDEA have interest in procuring 1,000 gallons of MBRF1's certified pharmaceutical grade alcohol per month at a base price of \$50.00 USD per gallon.

MBITA will additionally assist its clients using the MBRF1 pharmaceutical grade alcohol for end-product development in reaching new local, regional and international, pharmaceutical, holistic and retail food markets.

This Letter of Intent serves to confirm the Company's interest in establishing a non-binding agreement for the wholesale purchase of this available fuel supply and confirms the interest of Blume in providing access to said resources on an on-going basis. Blume will work with its customers to ensure access to the Company's growing fuel supply markets

To Whom It May Concern:

I work in the Early Care and Education (ECE) field as an ECE instructor and professional development coach. As a society, the care for children is one of our most precious and important jobs and childcare professionals work very hard to create a healthy, safe, joyful and educational environment. Hand sanitizing, in general, is a crucial aspect of this and state licensing and environmental quality assessment criteria direct educators and children to wash their hands upon entering the environment and in between all activities. This means that most adults and children wash their hands up to twenty times a day or more. In almost all cases, a hand sanitizer is considered an effective alternative to hand washing with soap and water.

Now that we are living under threat of COVID-19, an effective, ecological, convenient and cost effective hand sanitizer is needed more than ever. During the shelter in place mode, ECE programs that serve families working in fields that provide essential services must remain open to care for the children of these families. This includes agricultural work, which has its own set of health risks through exposure to chemicals and extreme weather conditions. Thus, some of our most vulnerable children and educators are in daily risk of exposure to, contraction of, or spreading the virus. I understand that Blume Distillation has been able to produce an organic, properly distilled hand sanitizer that could be distributed to ECE programs to increase and facilitate an effective and convenient self-protection regime during this pandemic.

I write to ask you to please provide Blume Distillation with support and a permit for the production and distribution of this much-needed defense against COVID-19. The health and safety of our community will greatly benefit.

Thank you,

A handwritten signature in black ink, reading "Roberta Reyes". The signature is fluid and cursive, with a long horizontal stroke at the end.

Subject: Hand sanitizer

Date: March 24, 2020 at 8:46:45 AM PDT

To: David Blume <dblume@blumedistillation.com>

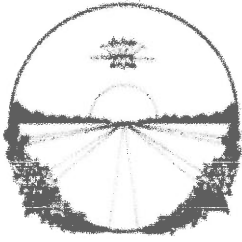

To Whom it may concern,

I am a practitioner of Chinese Medicine and Acupuncture in Watsonville, CA and was informed that Blume Distribution is collaborating with local herbalists to create an organic, safe and non drying hand sanitizer which is in short to no supply at the moment. In this moment of Crisis with COVID-19 we need to protect our healthcare providers as well as our clients and all of those in need.

All efforts and collaborations that provide safety and proper hygiene in our communities at this time are in desperate need. I write this letter to stress the importance and need of this work so our community can remain safe and healthy.

Sincerely,

Suzanne Snyder L.Ac.

Let Yourself Be Blessed

March 26, 2020

To Whom it May Concern:

As a health care professional, I have always strived for clean, sanitary conditions in my home and office environment.

During these uncertain times, this is even more important now. As soon as a local organic sanitizer is available through Blume Distillation, I will be using it frequently.

Thank you for your help in making this available quickly.

Sincerely,

Paulette Suzanne, BA, CNC, CCI

RE: The production of local sanitizer

April 1, 2020

To Whom It May Concern:

In these extraordinary times, we here at KSQD are taking great precautions to continue to provide an essential service as a community radio station to our listeners. In order to do that safely, we are regularly wiping down our console, microphones, surfaces and door handles with sanitizers, rubbing alcohol and other disinfectants. In some cases we have to drive miles to find more at a local store, but usually it is not produced here at home.

We understand that David Blume of Blume Distillation, an associate of one of our generous underwriters, (Ray Newkirk, Hauling Asteroids/Outside the Box Builders) is working on a proposal to create locally-sourced, organic sanitizer for local distribution. As a business that is going through multiple containers of sanitizer weekly, we would welcome supporting and using a locally-created product that also supported local jobs and local businesses.

We are proud that we continue to broadcast vital information to our local audience during these challenging times.

We hope we can all support each other in whatever way we can, be it health-wise or business-wise.

Thank you very much,

Sincerely,

Rachel Anne Goodman
Board Chair, KSQD Radio

Thank you for your offer from the COVID-19 Medical Supply portal at <https://covid19supplies.ca.gov/>. We have reviewed the information you provided and have sent it to the team working on continuing to build the response to COVID-19. If your offer of support aligns to their current needs, a team member will be in contact with you.

Through combined efforts and contributions from organizations like yours we have been able move forward in acquiring and securing the resources needed to effectively respond to COVID-19. There has been a tremendous outpouring of support to California, and we appreciate all you are doing.

Thank you for your support,

I recently heard that you were making hand sanitizer for Watsonville First Responders and I did sign up on your site. My request is not for me personally but to have on our fire apparatus for decon after responding to medical aids and traffic accidents. (www.midcoastfirebrigade.org)

Mid Coast Fire is one of only three 100% volunteer fire organizations run off of donations in Monterey County. As such we do not have the supply sources that the career organizations have and therefore we not able to purchase in large quantities before the world went crazy over hand sanitizer. We would like to be able to obtain 5 gallons and feel that this would hold us over but have been unable to find a source.

Please let me know if this is something that would be attainable. Cheryl Goetz, Fire Chief (831) 625-8175 office (831) 601-5718 cell

To Whom It May Concern:

I am a resident of Palm Beach County, Fla. I am an attorney working for NA and I would like to be able to purchase and immediately use for work and home, the Blume petroleum free, plant-based alcohol surface and skin sanitizer products that are being locally and organically produced by Monterey Bay Renewable Fuels1 (MBRF1) in Watsonville, CA.

Now, more than ever, it is crucial for the health and safety of everyone in the Tri-county area to have access to renewable supplies of sanitizing products that are essential to keeping our hospitals, businesses, administrative, and essential services operations open. Having local suppliers like MBRF1 can assure that doctors, medical staff, patients and practitioners are able to obtain this key solution to help reduce and eliminate exposure to the spread of the COVID-19 or any virus or disease.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting MBRF1 and encouraging the Blume brand we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

Now, more than ever, it is crucial for the health and safety of everyone in the Tri-county area to have access to renewable supplies of sanitizing products that are essential to keeping our hospitals, businesses, administrative, and essential services operations open. Having local suppliers like MBRF1 can assure that doctors, medical staff, patients and practitioners are able to obtain this key solution to help reduce and eliminate exposure to the spread of the COVID-19 or any virus or disease.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting MBRF1 and encouraging the Blume brand we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

I am a resident of Sacramento . I am a Insurance broker working for Victress insurance self employed and I would like to be able to purchase and immediately use for work and home, the Blume petroleum free, plant-based alcohol surface and skin sanitizer products that are being locally and organically produced by Monterey Bay Renewable Fuels1 (MBRF1) in Watsonville, CA.

Now, more than ever, it is crucial for the health and safety of everyone in the Tri-county area to have access to renewable supplies of sanitizing products that are essential to keeping our hospitals, businesses, administrative, and essential services operations open. Having local suppliers like MBRF1 can assure that doctors, medical staff, patients and practitioners are able to obtain this key solution to help reduce and eliminate exposure to the spread of the COVID-19 or any virus or disease.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting MBRF1 and encouraging the Blume brand we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

To Whom It May Concern:

I am a resident of Pacific Grove, CA I am a retired working for Organization and I would like to be able to purchase and immediately use for work and home, the Blume petroleum free, plant-based alcohol surface and skin sanitizer products that are being locally and organically produced by Monterey Bay Renewable Fuels1 (MBRF1) in Watsonville, CA.

Now, more than ever, it is crucial for the health and safety of everyone in the Tri-county area to have access to renewable supplies of sanitizing products that are essential to keeping our hospitals, businesses, administrative, and essential services operations open. Having local suppliers like MBRF1 can assure that doctors, medical staff, patients and practitioners are able to obtain this key solution to help reduce and eliminate exposure to the spread of the COVID-19 or any virus or disease.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting MBRF1 and encouraging the Blume brand we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

To Whom It May Concern:

I am a resident of King city,ca .I am a Correctional officer working for CDCR and I would like to be able to purchase and immediately use for work and home, the Blume petroleum free, plant-based alcohol surface and skin sanitizer products that are being locally and organically produced by Monterey Bay Renewable Fuels1 (MBRF1) in Watsonville, CA.

Now, more than ever, it is crucial for the health and safety of everyone in the Tri-county area to have access to renewable supplies of sanitizing products that are essential to keeping our hospitals, businesses, administrative, and essential services operations open. Having local suppliers like MBRF1 can assure that doctors, medical staff, patients and practitioners are able to obtain this key solution to help reduce and eliminate exposure to the spread of the COVID-19 or any virus or disease.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting MBRF1 and encouraging the Blume brand we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

To Whom It May Concern:

I am a resident of Santa Cruz . I am a Senior Director working for Lumentum and I would like to be able to purchase and immediately use for work and home, the Blume petroleum free, plant-based alcohol surface and skin sanitizer products that are being locally and organically produced by Monterey Bay Renewable Fuels1 (MBRF1) in Watsonville, CA.

Now, more than ever, it is crucial for the health and safety of everyone in the Tri-county area to have access to renewable supplies of sanitizing products that are essential to keeping our hospitals, businesses, administrative, and essential services operations open. Having local suppliers like MBRF1 can assure that doctors, medical staff, patients and practitioners are able to obtain this key solution to help reduce and eliminate exposure to the spread of the COVID-19 or any virus or disease.

Beyond the time of this crisis it will still be of benefit for our local community of health care providers to source things nearby and made with care. By supporting MBRF1 and encouraging the Blume brand we can ensure that regardless of the larger climate in the country or world, that Santa Cruz local businesses will stay strong.

Sincerely

Cannabis manufacturing (subject to SCCC 13.10.650)[†]			
Classes 1—3			
Outside Coastal Zone and 1-mile buffer, new or existing legal structure			
< 2,000 square feet	4	4	3
2,000—20,000 square feet	5	5	3
Over 20,000 square feet	6	6	3
Inside Coastal Zone and 1-mile buffer, existing legal structure			
< 2,000 square feet	4	4	4
2,000—20,000 square feet	5	5	4
Over 20,000 square feet	6	6	5
Cannabis distribution (subject to SCCC 13.10.650)[†]			
Class 1			
Outside Coastal Zone and 1-mile buffer			
Existing legal structure	3	3	3
New structure	4/5/6*	4/5/6*	4/5/6*
Inside Coastal Zone and 1-mile buffer			
Existing legal structure	4/5/6*	4/5/6*	4/5/6*
New structure	—	—	—
Class 2			
Outside Coastal Zone and 1-mile buffer, new or existing legal structure	4/5/6*	4/5/6*	4/5/6*
Inside Coastal Zone and 1-mile buffer, existing legal structure	4/5/6*	4/5/6*	4/5/6*

USES	M-1	M-2	M-3
^F With a license appropriate for zoning classification pursuant to Chapter 7.128 SCCC. No new non-retail commercial cannabis structures may be permitted in the Coastal Zone and 1-mile buffer.			
^N Level 4 approval applies to all use permits where the parcel is adjacent to another parcel zoned PR or a parcel zoned A, AP, RA, RR, R-1, RB, RM, TP, SU which contains a residential structure.			
**Outdoor or hoop house cultivation may be permitted only in conjunction with adoption or amendment of a reclamation plan.			
Commercial services , general, indoor, as allowed in the C-4 District (see chart, SCCC 13.10.332(B))	4/5/6*	4/5/6*	—
Commercial services , general, involving outdoor use or heavy trucking, as allowed in the C-4 District (see chart SCCC 13.10.332(b)), and also including: Blacksmith shops Boat building (not including ship building)	4/5/6*	4/5/6*	—
Community facilities , such as: Bus depots and transit stations, including repair or servicing of vehicles Community energy systems (subject to the provisions of SCCC 13.10.661 and 13.10.700-E definition) Utilities, public, structures and uses, including: Public service pumping stations Public utility service yards Power substations and transmission facilities Energy facilities (see SCCC 13.10.700-E definition)	4/5/6*	4/5/6*	4/5/6*
Hatcheries , poultry (see SCCC 13.10.700-H definition)	4/5/6*	—	—
Industry, heavy , involving hazardous chemicals or possible adverse impacts beyond the site, such as: Manufacturing of hazardous chemical products including: acetylene, aniline dyes, ammonia, carbide, caustic soda, cellulose, chlorine, cleaning and polishing preparations, creosote, exterminating agents, hydrogen and oxygen, industrial alcohol, nitrating potash, pyroxyline, rayon yarn, and carbolic, hydrochloric, picric, and sulphuric acids Manufacture of: asphalt, cement, explosives, fertilizer, film, fireworks, fish products, fuel briquettes, gelatine, glue, lard, paint products, paper, plaster, rubber, soap, vinyl floor covering Fat rendering Foundries, metal smelting, reduction, refining, alloying, rolling, drop forges	4/5/6*F	4/5/6*	—

USES	M-1	M-2	M-3
Incinerators			
Petroleum products refining			
Rubber processing			
Steam plants			
Slaughter houses, stockyards			
Stone mills			
Storage of potentially objectionable or hazardous materials including: explosives, fireworks, flammable liquids, gas, junk yards, manure, petroleum products, slag piles, rawhides, used building materials			
Tanneries			
Wood processing, including planing mills, sawmills and treatment plants			
Wood pulp reduction and distillation			
Manufacturing, light, and assembly, such as:	4/5/6*	4/5/6*	—
Manufacturing, assembling, compounding, packaging, and processing of articles of merchandise from previously prepared materials			
Manufacturing and assembly of:			
Appliances, medical and orthopedic			
Appliances, small electric, such as lighting fixtures, irons, fans, toasters and electric toys (not including refrigerators, washing machines, dryers, dishwashers, and similar large appliances)			
Ceramic products, small, such as pottery, figurines, and small glazed tile, using only previously pulverized clay and kilns fired only by electricity or gas			
Cosmetics, perfumed toilet soap (not including refining or rendering of fats or oils), or toiletries			
Electrical equipment, such as radio and television receivers, phonographs and home motion picture equipment (not including electrical machinery)			
Electrical supplies, such as coils, condensers, crystal holders, insulation, lamps, switches, and wire cable assembly; provided, that no noxious or offensive fumes, odors or particles are released outside the building.			
Electronics equipment and precision instruments, involving assembly of previously prepared materials			
Ice			

USES	M-1	M-2	M-3
Instruments: scientific, medical, dental, and drafting			
Mattresses			
Musical instruments			
Optical goods			
Photographic equipment (except film) and cameras			
Signs, electric and neon, billboards, commercial advertising structures			
Sheet metal products, light, including heating and ventilating ducts, cornices and eaves			
Watches and clocks			
Manufacturing, heavy, and processing, such as:	4/5/6*	4/5/6*	—
Manufactured, fabrication, and assembly of the following products; provided, that no environmental hazard is created: products of cement, ceramics, nonhazardous chemicals, clay, graphite, leather, metal, paper, rubber, stone, wood			
Manufacturing and processing of:			
Aircraft			
Automobiles			
Batteries			
Boilers			
Boxes			
Building materials			
Business machines			
Cans			
Candles			
Carpets			
Feed			
Fibers			
Firearms			
Glass			
Machinery			
Metal alloys: cable,			
Foil sheets, and wire			
Wire			
Motors and generators			

USES	M-1	M-2	M-3
Railroad equipment			
Electrical appliances			
Fabrics			
Textiles, knitting and hosiery mills			
Tires			
Manufacturing involving chemicals, such as:			
Drugs and pharmaceuticals, manufacturing, assembling, compounding, packaging and processing of			
Laboratories			
Photographic developing and printing plants			
Textile bleaching and dyeing			
Electronics, manufacture of such products as semiconductors or other components involving hazardous substances			
Food processing, and packaging, including:			
Bottling works			
Breweries, distilleries and wineries			
Cold storage plants			
Dairy products plants			
Foods and food products, manufacturing, canning and packing, or including fruits and vegetables (not including fish and meat products, pickles, sauerkraut, vinegar or yeast, or refining fats or oils)			
Metal products, manufacturing of, such as:			
Cutlery, hardware and hand tools; die and pattern making; metal stamping and extrusion of small products such as costume jewelry, pins and needles, razor blades, bottle caps, buttons and kitchen utensils			
Machine shops (involving the use of drop hammers, automatic screw machines or punch presses with a rated capacity of over 20 tons)			
Metal casting, painting and sandblasting			
Metal finishing and plating			
Welding shops			
Woodworking, such as:			
Cabinet-making shops			
Furniture manufacture			

USES	M-1	M-2	M-3
Woodworking shops, sash and door manufacturing, including only incidental mill work, operated within a completely enclosed structure			
Mining uses, such as:			
Mining, quarrying, and commercial extraction of rock, sand, gravel, earth, clay and similar materials, and the storage, stockpiling, processing, distribution and sale thereof; including the installation and operation of facilities and apparatus to process, store, and ship rock, sand, gravel and other mineral products; shops and garages for the repair and maintenance of equipment and warehouses for the storage of equipment or supplies as are necessary to conduct the uses permitted.	—	—	MP
Mine reclamation or reuse, uses and operations related to, such as backfilling with inert materials			
Industrial uses related to processing or fabrication of a finished product from quarried or mined materials, where associated with the principal use of the property for quarry purposes, located on the same site, and included in the provisions of a mining permit, including:			
Concrete batching plants			
Manufacture of cement			
Manufacture of concrete products and pressed structural units in conjunction and concurrent with excavation on the site			
Mixing plants for asphaltic concrete			
Other similar uses relating to the extraction or processing of rock, sand, gravel, or minerals			
Mine-related concurrent uses, such as: sanitary land fills; septage disposal; retail sales of mine related products; offices; public utility facilities; fire protection facilities			
Mine site interim uses, such as:			
(1) Agricultural uses subject to the regulations of the A District	Allowed at approval levels required by SCCC 13.10.312		
(2) Timber harvesting	—	—	P
Motor vehicle wrecking yards	4/5/6*F	4/5/6*	—
Mushroom growing in structures	4/5/6*F	4/5/6*	—
Offices, incidental to an allowed use	4/5/6*	4/5/6*	4/5/6*
Railroad stations	4/5/6*	4/5/6*	—
Railroad freight stations , repair shops, and yards	4/5/6*	4/5/6*	—

USES	M-1	M-2	M-3
Residential uses:			
Child care homes, small family (must be in conjunction with residential use) (see SCCC 13.10.700-C definition)	P	P	P
Retail sales , incidental to an allowed use	4/5/6*	4/5/6*	4/5/6*
Temporary uses (see SCCC 13.10.700-T definition), such as:	3	3	—
Carnivals and circuses			
Christmas tree sales lots			
Outdoor sales, not to exceed 4 per year on any site			
Warehouses (except for the storage of flammable liquids), storage and baling of metal, paper or rags within an enclosed structure	4/5/6*	4/5/6*	4/5/6*
Wireless communications facilities , subject to SCCC 13.10.660 through 13.10.668, inclusive	5	5	5

[Ord. 5302 § 3, 2019; Ord. 5272 § 5, 2018; Ord. 5119 §§ 23, 24, 2012; Ord. 4921 §§ 9, 10, 2008; Ord. 4873 § 3, 2007; Ord. 4836 § 86, 2006; Ord. 4808 § 18, 2005; Ord. 4770 § 5, 2004; Ord. 4744 § 5, 2003; Ord. 4715 § 5, 2003; Ord. 4577 §§ 5, 6, 1999; Ord. 4525 § 7, 1998; Ord. 3767 § 2, 1986; Ord. 3593 § 9, 1984; Ord. 3432 § 1, 1983].
